

Give every physical-AI use case a platform address before giving it a roadmap slot.

A compact review for deciding whether a customer problem should use existing platform contracts, extend them, remain federated, or stop.

1 · FRAME THE WORK

FIELD	REVIEW PROMPT
Customer annoyance	What concrete repeated friction is occurring in the actual workflow—not only the executive goal?
Performed unit of work	What action, step, output, cycle, or decision is the platform trying to understand or influence?
Outcome and baseline	What customer outcome should move, in what unit, against what current baseline or clearly labeled assumption?
Users and authority	Who performs, supervises, configures, reviews, owns, and can override the workflow?
Environment	Which site, station, asset, product, conditions, languages, camera/hardware, and network constraints matter?

2 · RESOLVE THE FIVE COORDINATES

COORDINATE	REQUIRED DEFINITION	MINIMUM EVIDENCE
Work identity	Process, role, asset, product, site, SOP/version	Stable identifiers and approved source
Expected action	Steps, sequence, tolerances, output, permitted variation	Expert-approved standard
Observed execution	Video, photo, event, timing, motion, context	Representative and legally usable data
Evidence contract	Confidence, latency, error posture, exception, human authority, recovery	Evaluation set and decision owner
Learning return	Variation, override, outcome, drift, SOP/model change	Instrumentation and review cadence

Decide the platform posture—and make the test falsifiable.

3 · PLATFORM FIT

LAYER	EXISTING CAPABILITY	GAP / EXTENSION	OWNER
Ontology and event model			
AI/model service and evaluation			
API / integration contract			
Identity, security, governance, data lifecycle			
Observability, support, and recovery			
Builder and frontline experience			

4 · IN-MARKET EXPERIMENT

HYPOTHESIS	SUCCESS EVIDENCE	GUARDRAIL / STOP CONDITION	REVIEW DATE

FIRST VALUE	TRUST	ADOPTION	OUTCOME	ECONOMICS / BURDEN

5 · DECISION POSTURE

Use
Existing platform contract

Extend
Reusable shared capability

Federate
Legitimate domain variation

Stop
Insufficient value or evidence

DECISION RECORD

Decision: _____ Owner: _____

Reasoning and evidence:

What this deployment returns to the platform: _____

The test is not whether the feature can work.

The test is whether it solves a consequential annoyance, earns trust in context, reaches value with acceptable burden, and produces a capability or learning worth retaining.
